

Eddie Bravo on Elon Musk's Dismissal of Overpopulation

The Joe Rogan experience What do you think about Elon Musk saying that overpopulation is a myth and it's actually the opposite What do you think about that Well it is the opposite in places where the developed world exists Like in in big cities people are having less Children Yeah I know a lot of a lot of guys in their forties that are not even close to being married No kids they're not gonna have kids that's happening everywhere So it's lifestyle choices for sure that happen when people live in big cities and they concentrate on their career It also happens when uh in these uh people are in the big cities though right And where women aren't oppressed where women aren't oppressed and they can pursue careers they pursue careers and they put off childbirth It's like that that's the theme of idiocracy Remember the remember idiocracy that I hear about it all the time So recently it's fuck I gotta go I love the new Beavis and Butthead movie better than ever I haven't seen it yet The movie it's like two months old So good I had Mike judging here a couple of months ago dude they go to space dude People go to fucking dude It's so good It's so good So the premise of Idiocracy is there's this really smart couple and they keep putting it off keep keep putting it off having kids And at the same time you're showing this dude who lives in a trailer park he's fucking all these chicks near him He knocks up her and she's chasing him with a frying pan She finds out he knocked up her too and it's wild and it's just like it just shows how people are just getting dumber and dumber The dumber people are overpopulating the smart people aren't having any Yeah like the bit from 2005 So that's really what it is I mean this is exactly what Elon is saying is that in these cities there is a depopulation problem Then there's also another problem Shanna Swan We had her on the podcast She wrote a book called Countdown and it's all about thal eights and how thal eights are getting into people's blood supplies from plastics and how it's directly affecting our reproductive systems It's making men's dicks smaller and smaller and taints smaller And the way they identify mammals males or females is the male's taint is 50 to 100% larger And the introduction of thal its they know these from studies when you introduce thal into the blood supply of these these creatures like mice and rodents and shit like that They're all of their taints shrink and that's exactly what's happening to people and we have palates in our blood So they do these these blood tests on people and they find all these microplastics and all this residue from petrochemical products And if you look at when petrochemical products are

introduced and plastics are introduced in America and then look at sperm counts look at miscarriage rates look at dick sizes all that stuff Testicle size is all shrinking That part All shrinking If a girl a girl licks your taint does she get credit for eating man ass It's pretty close She's in the neighborhood you know it's like your Beverly Hills or does she get credit I think she does Ok That's a risky So remember I don't know if you remember but I I brought this up on the podcast before and I don't know if it's true I hear it No Uh you got we didn't have a de a debunking website or whatever But um the saying that the entire population of the world whatever it is 7 billion or something can all fit in Texas or Alaska in their own house Remember that I think if you stuffed everybody together like a favela Totally Totally Right It would have to be that way Right And then the rest of its farmland But even even even if it wasn't Texas it has to be the whole United States Like you could fit the whole population of the world of the world in the United States They're saying you could fit them in Texas or Alaska That's what they're saying Nobody's debunked that And I I don't know you probably could fit him physically The problem is where are you going I'm not saying I'm not saying I'm not saying hey let's let's all move him to Alaska This is just oh here it is standing shoulder to shoulder The entire world's population could fit within 500 square miles of what Ok So talk about that So if that's true so it must be true right If that's true even if let's just say that's off and it's only the UN the whole United States I know it's only L A right If that's true there ain't nobody on this motherfucker dude That would mean if we got everybody in Alaska or everybody in Texas and the whole world was empty All of South America Asia Russia To me that means this overpopulation bullshit is a fucking myth man But wait a minute that doesn't make any sense because what they're saying in this Los Angeles thing is people standing shoulder to shoulder I'm just saying if that's true If that's no no I'm not saying to live that way I'm just saying if you can do that if you could fit the whole population there's plenty of room for everybody Dude back in the when I first started flying and uh teaching seminars all over the world I would always just look out the plane and go All I see is just nobody I see a city way over there City way over there and go It's empty I go we should all have a plot of land That's what I'd be thinking I go there's so much wasteland when you fly across the United States Dude there's only people in L A New York Miami and San Francisco Everything else is empty dude You're on a plane There's nobody there's nobody here So I don't want So when people talk about climate change well we're we're causing climate change or overpopulation and then you got Elon

Musk and that's the one thing I'm like damn Elon Musk is saying that he's saying that overpopulation is a myth That's actually the reverse like whoa So I don't wanna hear anything about an over fucking population Oh it's it's it seems overpopulated when you're in a city and you're living in a fatherland and they got you all crammed into a city super smart cities and all that shit Yeah it's overpopulated but the rest of the world's empty It's fucking empty Well there's a lot of people that you have to feed That's the problem The problem is not just the number of people The problem is the resources Do you believe cow farts are melting Icebergs Cow farts are not the problem It's actually burps it's methane it's methane but it's just but there's also ways they use regenerative farming So it's carbon neutral You know there's people that have like discussed regenerative farming The only problem is like scaling it for millions and millions of people but it's just a natural product of animals eating grass They they do know that that happens dude Do you know how bad those farts gotta stink to melt icebergs It's not that it's melting iceberg It's just releasing me that climate change It's all about melting icebergs rising sea levels It's all about the iceberg but it definitely it definitely contributes to the gasses Do you know that Have you ever gone to like one of those places that just grow cows My parents used to live in Harrisburg Pennsylvania I used to have to drive through farmland bro It smells so bad It smells so bad Like the people that I've driven through farmland before you could smell the cow shit No it's not just cow shit where they raise cattle not not I mean like millions and millions of cows I will never believe cow farts are causing climate There's no way anybody's going to believe that the burps it's contributing to the gasses that are in the environment that you know what Dan Pena is saying And what with uh Steve Coonan is saying more specifically is that we're talking about a negligible effect in comparison to all these other effects I wanna I wanna see a documentary on how they they found out cows are are burning a whole of it's really burps It's just it's just methane man But I'm telling you these uh carbon neutral farmers these people that use regenerative farming they take the manure and they put it back into the soil and that's that's what they use for fertilizer and everything is organic And they're saying if you do it that's the animals and the environment are supposed to interact What we've done that's so fucked is factory farming And we've taken all these animals and shoved them into these places and made these toxic lace waste lakes of animal waste Have you seen those where they like fly a drone over these um factory farming setups they have for pigs Like dude if everybody wants sausage and everybody wants bacon you need a lot of

fucking pigs A lot of pigs and it's horrific what they have to do to raise pigs in an economical way So you can get cheap bacon is pretty fucked That's real And that is 100% contributing to the amount of methane that gets released and gasses that get really because if you go anywhere near those places they're fucking terrible toxic They smell awful man Like that shit's if you live in that city and they open up like a some sort of a factory farming setup right outside of town guess what Your city's ruined You're gonna smell that shit You're gonna smell and you're gonna get used to the smell Unfortunately because all factory senses they all factory senses detect changes in smells That's why people stink They don't smell themselves because otherwise be like oh my God I smell I gotta get the fuck out of here You detect changes in smell So if you live in a place that stinks like some parts of New Jersey when they were like really polluted they have factories out there The people that live there didn't even know it stunk People had to come visit them and go What the fuck are you living Where are you living man You know how bad it smells here That makes it smells normal because they're used to it They get accustomed to it that 100% is contributing to pollution So whether it's factory farming or whether it's factories all the different things that people do that we enjoy If you want electricity something's got to burn Like how do you do it Do you use coal What do you do unless you're gonna do nuclear Is it gonna you're gonna have some fucking you're gonna have some negative effect
